

Ensemble

A simple, fast DAW

User Guide

Record - Build beats - Mix - Harmonize - all locally in your browser

1. Welcome to Ensemble

Ensemble is a music workstation built around one idea: make the few things you actually reach for fast and obvious. You can record live, lay down a beat that locks to the tempo, add automatic accompaniment, and mix - without the thousand-panel learning curve of a traditional DAW.

Everything runs locally. Your audio never leaves your machine (the one exception is voice control, explained in section 10). Projects autosave to your browser as you work.

- Transport with tempo, metronome and loop
- Live microphone recording with waveforms
- A Beat Maker (step sequencer) with swappable drum kits
- Harmonize: analyze a track and auto-generate matching instruments and drums
- A mixer with volume, pan, mute, solo and a master meter
- Voice control and one-key shortcuts
- Export your finished song to a .wav file

2. The layout

The screen has four zones, top to bottom:

- Top bar: project name, Projects, Add/Import track, Harmonize, Export WAV, Voice, and the autosave indicator.
- Transport bar: rewind, play/stop, record, loop, the bar.beat readout, Tempo, Length and the metronome (Click).
- Arrange view: one row per track with a moving playhead. Click the ruler to move the playhead.
- Bottom dock: the Beat Maker on the left and the Mixer on the right.

Tip

Hover over anything in Ensemble. Every button, slider and label has a plain-language tooltip that explains what it does.

3. Getting started in 60 seconds

1. Press Play (or the Spacebar). You will hear the starter beat and the metronome click.
2. Change the Tempo field to taste - the beat and click follow instantly.
3. Click squares in the Beat Maker to add or remove drum hits.
4. Press the Loop button (the circular arrows) so playback repeats while you experiment.
5. Open Projects, type a name, and press + New to start your own song. From here on it autosaves.

4. Recording live from your microphone

This is the core workflow for capturing vocals, guitar, or any instrument through your audio input.

1. Click + Audio Track to make a track to record onto (a new track is automatically record-armed - the red dot).
2. If you have several audio tracks, click the red record-arm dot on the one you want. Only one track arms at a time.
3. Turn on the metronome (Click) if you want a tempo guide while you play.
4. Press the Record button (or the R key). Ensemble starts playback and begins capturing from your mic.
5. The first time, your browser asks for microphone permission - click Allow.
6. Play or sing. When you are done, press Record again (or R) to stop.
7. Your take appears on the armed track as a waveform clip, placed where the playhead was when you started.

Where does my recording start?

A take is placed at the playhead position from the moment you hit Record. Rewind to the start (the |< button) first if you want to record from bar 1.

Recordings are 16-bit WAV internally and are saved with the project so they survive a reload.

5. Adding and importing tracks

Add an empty audio track

Click + Audio Track in the top bar. Use this when you plan to record into it.

Import an existing audio file

Click Import and choose a .wav, .mp3, .m4a or similar file (for example, a guitar part you recorded elsewhere). Ensemble decodes it, draws its waveform, and drops it onto a new track at bar 1. Imported tracks can be mixed, exported, and - importantly - analyzed by Harmonize.

6. The Beat Maker

The Beat Maker is a 16-step sequencer. Each row is a drum sound; each of the 16 squares is a sixteenth note. A lit square plays that sound on that step. The whole pattern repeats every bar and always stays in time with the project tempo.

Pick a kit, then swap any piece

1. Use the kit dropdown next to the Beat Maker title to choose a full set of sounds (Studio, 808/Trap, Acoustic, Punchy Pop, Lo-Fi).
2. To swap just one piece, use the small dropdown on that row - for example change only the snare, or pick a Crash instead of a Ride on the cymbal row.
3. Swapping a single piece switches the kit label to 'Custom'. Picking a kit again resets all six pieces.
4. Click a row's name to audition that sound. Picking a new sound auditions it immediately.

Swing and clear

- Swing nudges every other sixteenth later for a looser, human groove. All the way left is dead straight.
- Clear turns every step off but keeps your chosen kit.

7. Transport, tempo and loop

Control

Play / Stop	Transport / Spacebar	Starts or stops playback from the current position.
Record	Transport / R key	Arms capture from your mic onto the armed track and starts playback.
Loop	Transport	When on, playback repeats the whole arrangement instead of stopping at the end. The wrap is seamless.
Rewind	Transport (<)	Jumps the playhead back to bar 1.
Tempo	Transport	Beats per minute, 40-260. Drums, metronome and generated parts all follow it.
Length	Transport	Song length in bars, 1-64. The arrangement and loop span this length.
Click	Transport	Toggles the metronome on each beat.

8. Mixing

The Mixer (bottom-right) has one channel strip per track plus a Master strip.

- Volume fader: how loud the track is. Drag up or down.
- Pan slider: places the track left or right in the stereo field.
- M (Mute): silences the track.
- S (Solo): hears only the soloed track(s) and mutes everything else.
- Master strip: overall output volume with a live level meter. Keep the meter out of the red to avoid clipping.

Per-channel effects

Each channel strip has quick effects plus a full effects rack:

- On the strip: LO / MID / HI EQ (boost or cut, -12 to +12 dB) and a REV reverb send.
- Click the gear (the small cog button) for the full rack on that channel.

The full rack adds:

- Sweepable EQ: set the frequency of each band and the width (Q) of the mid band, so you can hunt for a specific tone rather than fixed bands.
- Reverb: send amount.
- Delay (echo): amount, feedback (how many repeats), and a Sync setting that locks the echo time to the tempo - 1/4, 1/8, dotted or triplet - or Free to dial milliseconds by hand.
- Compression: evens out the level and adds punch - higher amount = more squash.

You do not have to touch any of it by hand. Everything here can be driven by a typed or spoken command - see section 10 - for example "add reverb to channel 1", "add delay to channel 2", "compress channel 1", or "cut the lows on channel 2". All effects are baked into the exported mixdown.

The Master strip has its own FX rack too (the gear on the Master channel): the same EQ, compression and limiting applied to the whole mix. Drive it by saying "compress the master" or "bring up the highs on the master".

9. Harmonize - automatic accompaniment

Harmonize adds instrument parts (and optionally drums) that fit your song. It can work from scratch, or it can listen to an existing track, show you what it hears, and let you correct everything before it plays a single note.

The simple path

- 1. Click Harmonize in the top bar.
- 2. Pick a Key, Scale (major = bright, minor = moody), Chords (progression) and a Style.
- 3. Choose which instruments to add: Bass, Keys/Pad, Pluck/Arp, Lead - and tick Drums to also lay down a fitting beat.
- 4. Press Generate. The parts appear as normal tracks you can mix or mute.

Example: turn a lone guitar into a full arrangement

- 1. Import your guitar recording (Import button).
- 2. Open Harmonize. Under 'Analyze a track', choose the guitar and press Analyze.
- 3. Ensemble shows what it hears: an estimated tempo, an energy/freneticism level, the key and scale, and a bar chart of the notes it detected.
- 4. Correct anything that looks off. Click a different note bar to change the key, switch major/minor, drag Energy, or pick different Chords. Press 'Use NNN BPM' to match the project tempo to the detected tempo.
- 5. Tick Drums + Bass + Keys, set a Style (say, Rock), nudge octaves if a part sits too low or high, and press Generate.
- 6. Press Play. Mute or rebalance any generated part in the Mixer. Re-open Harmonize and Regenerate to try another feel.

These are estimates you control

Tempo, key and energy detection are best-effort estimates from the audio, not ground truth. The whole point of the preview is that you get the final say - every value Ensemble guesses is editable before you generate.

Fine-tuning controls

Control

Key	C - B	The root the parts are built around.
Scale	Major / Minor	Bright and happy vs. dark and moody chord/note choices.
Chords	6 progressions	The chord per bar the parts follow (e.g. Pop I-V-vi-IV).
Style	Pop..EDM	Overall feel: arp speed, swing, and the flavour of the generated beat.

Energy	Relaxed - Frantic	How busy and hard the parts play. The arp also follows your hi-hat density.
Octave	-2 .. +2	Shift any one instrument up or down to fit the mix.
Drums	On / Off	Also (re)generate the Beat Maker pattern to match the style and energy.

Generated parts are ordinary instrument tracks. You can solo them, change their volume and pan in the Mixer, or remove them all with 'Remove generated' in the Harmonize panel.

10. Commands: type it, speak it, or click it

Ensemble has one command system with three front-ends, so you never have to remember a different vocabulary:

- **Type:** use the command bar under the transport. Type something like 'add reverb to channel 1' and press Enter.
- **Speak:** click Voice (top bar) and say the same thing. Speech is turned into text and run through the exact same command parser.
- **Click:** the buttons, faders and knobs do the same actions directly. Typing 'mute channel 2' and clicking that channel's M button are equivalent.

After any command, the command bar shows a short confirmation (for example 'Reverb on channel 1 (40%)'). Channels are numbered top to bottom, matching the mixer order.

One grammar, many phrasings

Parsing looks for intent and a channel number, not exact words. 'record channel one', 'record on channel 1', and 'arm channel 1' all do the same thing. Numbers work as words or digits.

Voice and how speech becomes text

Click Voice in the top bar to start listening (the button glows and a 'listening' indicator appears). Click again to stop.

Voice control uses the browser's built-in Web Speech API (SpeechRecognition). In a Chromium browser (Chrome or Microsoft Edge), the browser streams short snippets of microphone audio to its speech service and returns a text transcript. Because of that:

- It needs an internet connection and microphone permission.
- It works in Chrome and Edge. Safari and Firefox do not support it, and the desktop build follows the same rule as the browser it embeds.
- While listening is ON, audio is processed by the browser's speech provider. Turn Voice off when you are done to stop all listening. Nothing is recorded to disk by Ensemble.

How a command is understood

Whether typed or spoken, the text is lowercased and matched against a small, forgiving set of keyword patterns. It looks for intent rather than exact phrases, and extracts a channel number (as a word or digit) when present: 'bring up the highs on channel three' is read as EQ + high band + boost + channel 3. Voice recognition runs continuously, so you can issue one command after another.

If a command is not understood, the command bar shows a few clickable 'try:' suggestions based on what you typed - click one to run it. This makes the vocabulary discoverable without a manual.

Command reference

Type or say

play / stop	"play", "stop"	Starts or stops playback.
record channel N	"record channel 1"	Arms that channel and starts recording from the mic.
set channel N to playback	"playback channel 1"	Takes the channel out of record so it just plays back.
erase channel N	"clear channel 2"	Removes the recorded clips on that channel. "clear the beat" empties the Beat Maker.
mute / solo channel N	"mute channel 3"	Mutes, unmutes or solos a channel.
add reverb to channel N	"more reverb on 1", "remove reverb"	Sets the channel's reverb send (add / more / less / remove).
add delay to channel N	"more delay on 2", "remove delay"	Sets the channel's delay/echo send.
sync delay to a note	"delay in eighth notes on 1", "dotted eighth delay", "free delay"	Locks the echo time to the tempo (quarter / eighth / sixteenth, dotted or triplet).
compress channel N	"more compression on 1"	Sets the channel's compression amount.
EQ a channel	"bring up the highs on channel 2", "cut the lows on 1"	Boosts or cuts the low / mid / high band on that channel.
louder / softer channel N	"turn up channel 2"	Channel volume (or master, if no channel is named).
pan channel N left/right	"pan channel 1 left"	Positions the channel in the stereo field.
set tempo to N	"set tempo to 128"	Sets the project tempo.
metronome / loop on/off	"metronome off", "loop on"	Toggles the click or looping.
add a track	"new channel"	Adds an audio track.
harmonize	"add drums"	Opens the Harmonize panel.
export / bounce / mixdown	"render"	Renders the song to a .wav download.
export stems	"bounce tracks"	Bounces every track to its own .wav.
undo / redo	"undo", "redo"	Steps backward or forward through your edits.
split / duplicate / delete clip	"split clip", "duplicate clip"	Edits the selected clip.

snap on/off, zoom in/out	"snap off", "zoom in"	Grid snapping and timeline zoom.
count in on/off	"count in on"	One-bar pre-roll before recording.
move channel up/down	"move channel 2 up"	Reorders tracks.
clear loop	"clear cycle"	Removes the loop region.
effects on the master	"compress the master"	Targets the master bus instead of a channel.

11. Editing the arrangement

Recorded and imported audio sit on the timeline as clips you can shape:

- Move: drag a clip left/right to reposition it in time.
- Trim: drag a clip's left or right edge to shorten or extend it.
- Split: select a clip, put the playhead inside it, and Split (S key, or say/type "split clip").
- Duplicate: Ctrl+D, or "duplicate clip" - drops a copy right after the original.
- Delete: select and press Delete, or "delete clip".

Snap, grid and zoom

- Snap (the toolbar Snap button, or N) locks moves and trims to the grid.
- Grid sets the resolution edits snap to: bar, 1/2, 1/4, 1/8 or 1/16.
- Zoom in/out with the +/- toolbar buttons or the + and - keys to see more or less detail.

Loop / cycle region

Drag across the ruler to paint a loop region (a cycle). With Loop on, playback repeats just that region - perfect for working on one section. A single click on the ruler instead moves the playhead; 'Clear loop' (toolbar) or "clear loop" removes the region.

Undo / redo

Every edit is undoable: Ctrl+Z to undo, Ctrl+Shift+Z (or Ctrl+Y) to redo, or just say "undo". Rapid changes during a single drag collapse into one undo step. The toolbar also has undo/redo arrows.

12. The piano roll

Instrument tracks (from Harmonize, or any instrument track) can be edited note-by-note. Click the pencil on the track header, or double-click the track's lane, to open the piano roll.

- Add a note: click an empty cell. Drag right as you release to set its length.
- Move a note: drag its body up/down (pitch) or left/right (time).
- Resize: drag a note's right edge.
- Delete: double-click a note. 'Clear notes' empties the track.

Notes preview as you place them, and everything stays locked to the project tempo and grid.

13. Projects, autosave and export

- Autosave: every change is written to your browser automatically (the 'autosaved' chip up top).
- Projects panel: start a new named song, open or delete saved songs, Save current, or Export the project as a .json backup you can keep or share.
- Export WAV: renders the whole arrangement - drums, instruments and recordings, plus the master FX - to one stereo .wav, respecting your mix, mutes and solos.
- Export Stems: bounces each track to its own .wav (ignoring mute/solo) for handing off to another studio.

14. Keyboard shortcuts

Key		
Spacebar	Play / Stop	Ignored while typing in a text field.
R	Record	Toggles recording on the armed track.
S	Split clip	Splits the selected clip at the playhead.
Ctrl/Cmd + D	Duplicate clip	Copies the selected clip.
Delete / Backspace	Delete clip	Removes the selected clip.
Ctrl/Cmd + Z	Undo	Shift to Redo (or Ctrl/Cmd + Y).
N	Toggle snap	Snap edits to the grid on/off.
+ / -	Zoom in / out	Horizontal timeline zoom.

15. Troubleshooting

- No sound? Click anywhere first - browsers require a user gesture before audio can start. Then press Play.
- Microphone not working? Check the browser's site permissions and that the right input device is selected in your OS.
- Voice does nothing? Use Chrome or Edge, allow the mic, and make sure you are online.
- Recording is silent? Make sure the track is record-armed (red dot) and your input is not muted by the OS.
- A generated part is too loud or busy? Lower its fader in the Mixer, drop the Energy, or change its octave and Regenerate.

Ensemble - made for making music, not menus.
